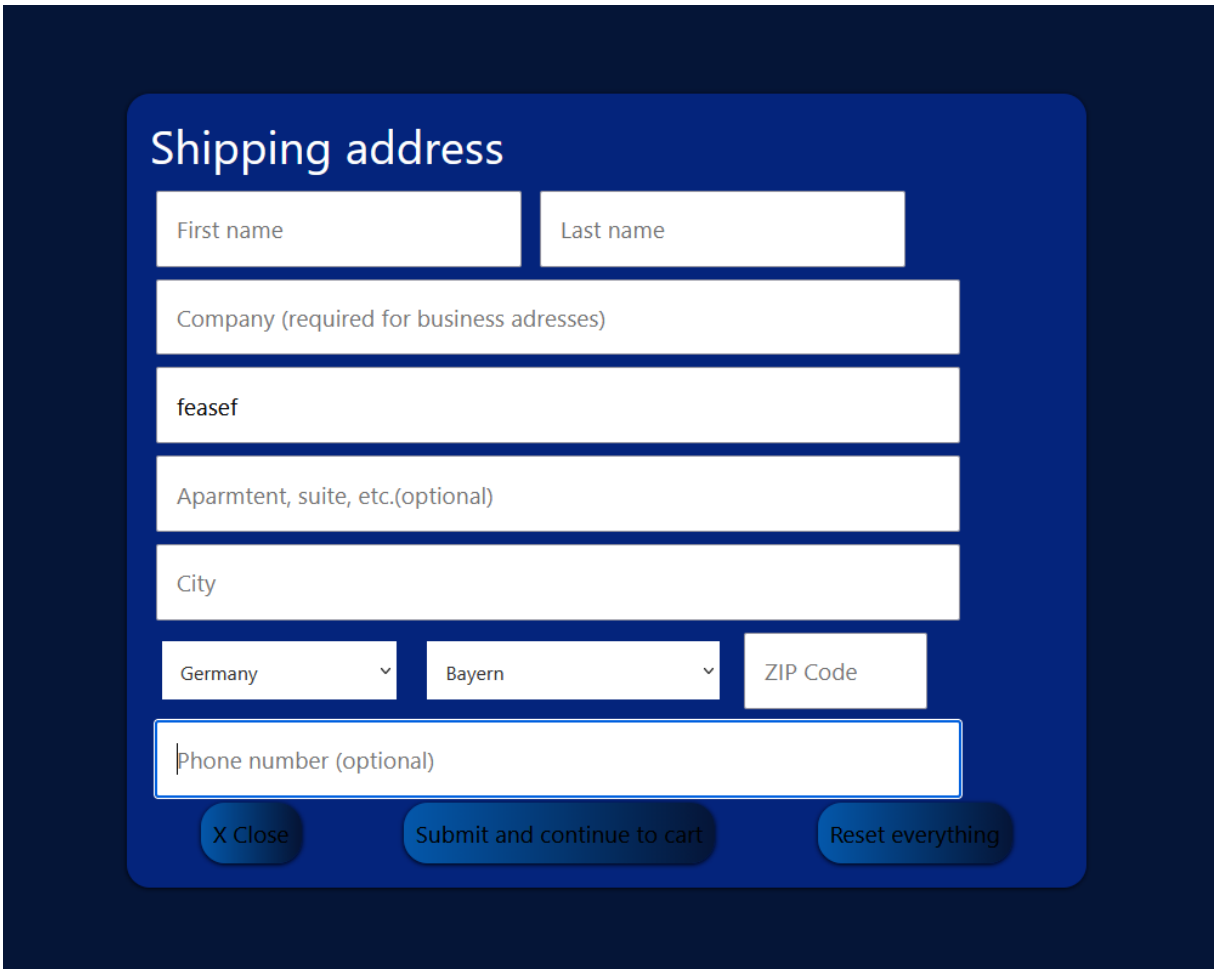
Assignment 2 from Elias Hoffstadt

Safe Seals in need

First page contains a small description and the Discount Code named SafeSeals

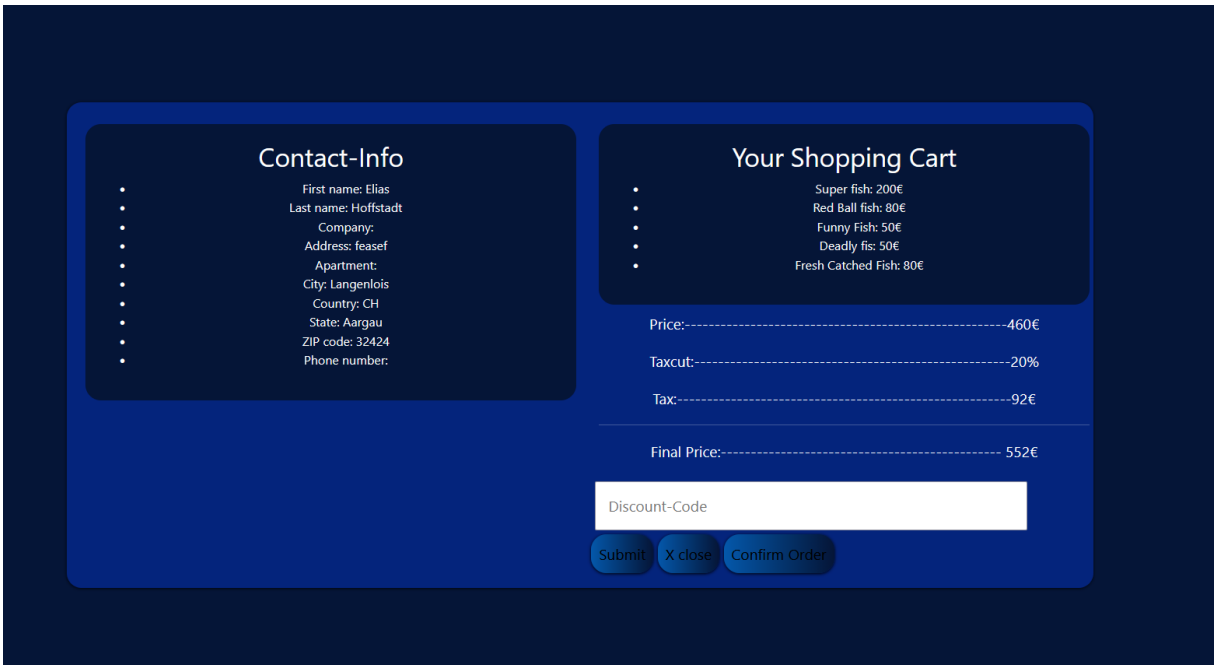
There is a small shop card list programmed with bootleg. 10 items can be bought for seals. Every card contains a buy button, a description, a picture and a price.

If you press checkout, the minimised form1 div gets maximised and looks like this:

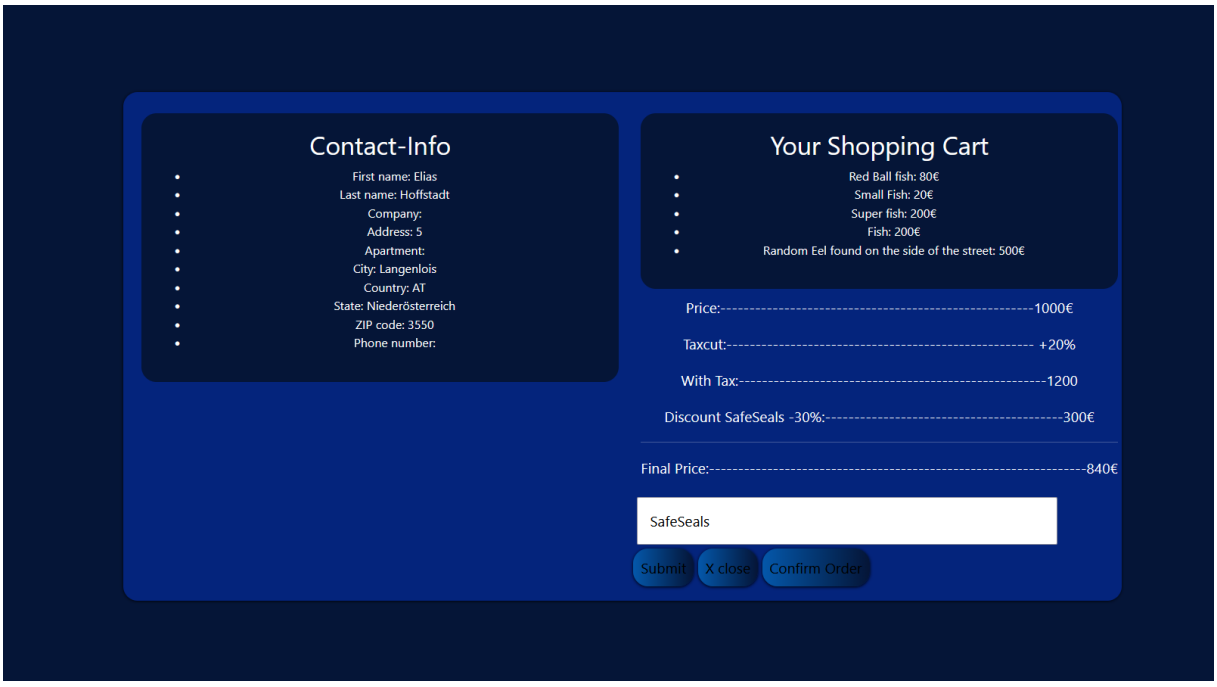


I programmed in js, that every, except the optional, field is required for continuing tot he Shopping cart. The ZIP Code and the Phone number are coded with regex, so that the zipcode needs to be at least 4 and max 6 numbers and can only contain numbers. You dont need to fill in the phone number, but if you do, it can only be 6-15 numbers. Only numbers are validated. If something is wrong, a corresponding alert is being shown on the screen. In addidtion. I added .innerhtml fort he states of germany, switzerland and austria. If you choose germany for example you get only german states. The options are coded in javascript.

There are 3 buttons. The first closes the form and directs you back to the shopping site. The second submits and saves the data being in the inputs. The submit button opens the form2 and with that the final shopping cart. The third button ist he reset button. It just resets every input.



The shopping cart displays your contact info and what you added to your shopping cart with the price. You see the price oft he items in the first line. After that comes, how much percent tax is being applied and the next how much Taxi s actually being added. The final price with tax is in the end. After this you can enter a discount code. If ist not more than 3 items or the discount Code is invalid. If you have more than 3 items and the code is valid, then you can press the submit button and the code is being applied:



In the Price div a new Line is being added and the Price got a deduction of 30% oft he price with Tax. If you click the button confirm order with an empty shopping cart, you get an alert that you need to add something and the formula wont get submitted. If you have something in your shopping cart and click this button, you get a thank you alert and the

formula gets submitted. Every list gets reset, so you can place a new order and you get linked to the Starting Shop.
